1. What is the main goal of adding polynomial features to a linear regression? 1 / 1 point

- Remove the linearity of the regression and turn it into a polynomial model.
- Capture the relation of the outcome with features of higher order.

  Correct! You can find more information in the Polynomial Regression lesson.
- Increase the interpretability of a black box model.
- Ensure similar results across all folds when using K-fold cross validation.

2. What is the most common sklearn methods to add polynomial features to your data? 1 / 1 point

Note: polyFeat = PolynomialFeatures(degree)

- polyFeat.add and polyFeat.transform
- polyFeat.add and polyFeat.fit
- polyFeat.fit and polyFeat.transform

  Correct! You can find more information in the Polynomial Regression lesson.
- polyFeat.transform

3. How can you adjust the standard linear approach to regression when dealing with fundamental problems such as prediction or interpretation? 1 / 1 point

- Create a class instance
- Add some non-linear patterns, i.e., polynomial features

  Correct! You can adjust the standard linear approach to regression by adding polynomial features when dealing with fundamental problems such as prediction or interpretation.
- Import the transformation method
- By transforming the data
